FGRO - Rotary gear limit switch with overall reduced sizes

The FGRO is a device for controlling revolutions of rotating components or the angular position of industrial or construction machinery.
A typical application is for small cranes. Also suitable for different applications such as automatic doors or automatic roofs in greenhouses.
The unit, through a system of gears and cams transmission, controls 2 or 4 microswitches so, after a certain number of revolutions, predispose the motor or the equipment to the start or stop operation.
The microswitches have a calibration screw that works independently on each cam; so you can calibrate the opening and closing of each micro according to the necessary functional requirements.
The system change allows you to choose different ratios from 1:12 to 1:1480.

## AVAILABLE VERSIONS

Base fixing 2 microswitches

Double overhang shaft 2 microswitches

Front fixing
2 microswitches

 4 microswitches
